## Document History

Version	Date	Description of Change	Hardware Version
V 1.0	2023-4-21	Preliminary Release	V 1.0
V 2.0	2024-1-9	Modify the product manual template; Added interface test description; Added Jetpack5.* version GPIO mapping number;	V1.0

## Hardware Update History

Version	Date	Description of Change
V 1.0	2023-4-21	Initial version

Electronic components and circuits are very sensitive to electrostatic discharge, although the company will design the main interface on the board card to do anti-static protection design, but it is difficult to do anti-static safety protection for all components and circuits. Therefore, it is recommended that you take ESD safety measures when handling any circuit board component.

**ESD safety measures include but are not limited to the following:**

1. Put the card in an ESD bag during transportation or storage. Do not take out the card until installation and deployment.
2. Before touching the board, release the static electricity stored in the body: Wear a grounding wrist strap.
3. Operate circuit boards only in electrostatic discharge safe areas.
4. Avoid moving circuit boards in carpeted areas.
5. Avoid direct contact with electronic components on the board through edge contact.

# 1 Introduction

Y-C17 is an interface board equipped with NVIDIA Jetson Orin NX/Orin Nano/Xavier NX series core modules. The whole board device adopts wide temperature industrial model, the main interface is designed for electrostatic safety protection, and the power supply application scheme with high reliability is adopted. The input power supply has the function of overvoltage and reverse polarity protection. With a rich external interface, it can be equipped with hundreds of functional modules through a miniPCIe connector (including USB2.0 and PCIe X1 signals) to achieve further expansion of system functions.

The Y-C17 power input interface is not welded by default, so it should be used with a [signal separation board](#). When using, please follow the screen printing on the signal separation board and correctly connect the positive and negative electrodes of the power cord. After the power cable is connected, please follow the signal separation board installation example and connect it to Y-C17 before powering the carrier board. **If the signal separation board is not used, please solder the power supply input interface by yourself, and do not connect any equipment to the J2 interface of Y-C17. The J2 interface does not support standard USB functionality. Accessing the device is easy to cause the device to burn.**

# 2 Specifications

	Specific
Carrier Board	Y-C17
Module	NVIDIA Jetson Orin NX/Orin Nano/Xavier NX Series Modules
Temperature	-40 ~ +85°C
Dimensions (L×W×H)	85mm * 63mm * 18mm (Including I/O ports and mounting holes)
Weight	45g

Power Supply	Spec
Input Type	DC
Input Voltage	+12V ~ +24V

## I/O Ports

Interface	Quantity	Interface	Quantity
Type-C	2	Nano SIM Card Slot	1
miniPCIe Slot	1	2 Lane MIPI CSI	1
M.2 Key M Slot (2230)	1	M.2 Key B Slot(3050)	1
RTC Battery Connector	1	Fan Header(5V)	1
Multi	1*i2c/4*GPIO/1*PSDK(uart + usb)

# 5 Connector Description

Jetson Module Connector (J1)	
Function	Connect NVIDIA Jetson Orin NX / Orin Nano/Xavier NX series modules
Sign	J1
Type/Model	2309413-1
Explain	For pin definitions of this connector, refer to the pin definition instructions in the NVIDIA Jetson Series Orin NX Core Module data book

Power Output Interface (J3)									
Function	The output voltage is 0.3V lower than the input voltage.								
Sign	J3								
Type/Model	XH-2AW								
Pin definition	<table border="1"> <thead> <tr> <th>Pin</th> <th>Signal</th> <th>Pin</th> <th>Signal</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>VOUT</td> <td>2</td> <td>GND</td> </tr> </tbody> </table> <p>Pin 1 position: right picture identification.</p>	Pin	Signal	Pin	Signal	1	VOUT	2	GND
Pin	Signal	Pin	Signal						
1	VOUT	2	GND						

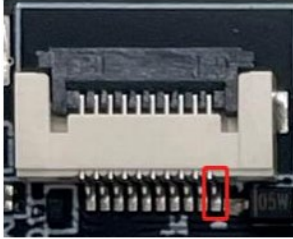

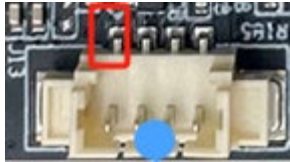

Type –C Connector (J2)																																																					
Function	Type C Connector, Use to flash system or connect to a DJI drone																																																				
Sign	J2																																																				
Type/Model	Standard Type C male connector																																																				
Pin definition	<table border="1"> <thead> <tr> <th>Pin</th> <th>Signal</th> <th>Pin</th> <th>Signal</th> </tr> </thead> <tbody> <tr> <td>A1</td> <td>GND</td> <td>B1</td> <td>GND</td> </tr> <tr> <td>A2</td> <td>NC</td> <td>B2</td> <td>GPIO13_PWM_3V3</td> </tr> <tr> <td>A3</td> <td>FORCE_RECOVERY</td> <td>B3</td> <td>NC</td> </tr> <tr> <td>A4</td> <td>SVIN</td> <td>B4</td> <td>SVIN</td> </tr> <tr> <td>A5</td> <td>GPIO06_PPS_3V3</td> <td>B5</td> <td>UART0_TX_3V3</td> </tr> <tr> <td>A6</td> <td>GPIO07_SELECT</td> <td>B6</td> <td>USB0_P</td> </tr> <tr> <td>A7</td> <td>USB0_VBUS_EN0</td> <td>B7</td> <td>USB0_N</td> </tr> <tr> <td>A8</td> <td>GND</td> <td>B8</td> <td>UART0_RX_3V3</td> </tr> <tr> <td>A9</td> <td>SVIN</td> <td>B9</td> <td>SVIN</td> </tr> <tr> <td>A10</td> <td>NC</td> <td>B10</td> <td>NC</td> </tr> <tr> <td>A11</td> <td>NC</td> <td>B11</td> <td>NC</td> </tr> <tr> <td>A12</td> <td>GND</td> <td>B12</td> <td>GND</td> </tr> </tbody> </table>	Pin	Signal	Pin	Signal	A1	GND	B1	GND	A2	NC	B2	GPIO13_PWM_3V3	A3	FORCE_RECOVERY	B3	NC	A4	SVIN	B4	SVIN	A5	GPIO06_PPS_3V3	B5	UART0_TX_3V3	A6	GPIO07_SELECT	B6	USB0_P	A7	USB0_VBUS_EN0	B7	USB0_N	A8	GND	B8	UART0_RX_3V3	A9	SVIN	B9	SVIN	A10	NC	B10	NC	A11	NC	B11	NC	A12	GND	B12	GND

# 7 Recovery Mode

Jetson core module can work in normal mode and Recovery mode. In Recovery mode, it can perform file system update, kernel update, Bootloader/UEFI update, BCT update and other operations. Y-C17 needs to be matched with the company's supporting signal separation board before it can enter the recovery mode and perform the above operations.

**To enter the Recovery mode, perform the following steps :**

- Power off the system;
- Connect the signal separation board A face up to the Type-C port (J2) of Y-C17;
- Use the Micro-USB cable to connect the Micro-USB port of the signal separation board with the USB port of the Jetson development host.
- Hold down the Recovery button on the signal separation board, **and then supply power to the system**. After power supply, keep the Recovery button pressed for more than 3 seconds, and then release the Recovery button.
- The system enters Recovery mode, at which time subsequent operations can be performed.

# 8 Method of Application

---

- Make sure all external system voltages are off.
- Install the Jetson core module onto the J1 high-speed connector. Ensure that the connectors are aligned with even force. After the module is installed in place, install the core module fixing screws.
- Install necessary external cables. (such as: the display line connected to the HDMI display, the power input line for the system power supply, the USB cable connecting the keyboard and mouse...)
- Connect the power cable to the power supply.(Make sure that the heat dissipation device on the core module is installed before power-on)
- For a system without a protective cover, do not move the hardware system after the system is powered on. Do not touch the circuit board or any electronic components on the circuit board with your body.

## 9 GPIO Test

---

Y-C17 with Jetson module comes standard with 4 GPIOs. Programmable output voltage 3.3V, please note that the input voltage does not exceed 3.3V.

Take L4T35.3.1, GPIO02 as an example when equipped with ORIN NX module:

The content after the '#' in the following command is a comment and does not need to be added when executing the command.

- `sudo su`
- `echo 446 > /sys/class/gpio/export #Enabel GPIO (Or initializeGPIO)`
- `echo out > /sys/class/gpio/PP.06/direction`  
# Set the GPIO input and output directions to out or in.
- `echo 1 > /sys/class/gpio/PP.06/value`  
# Set the GPIO output high/low level to 1 for high and 0 for low.

# The preceding absolute path name is based on the actual path name generated after GPIO is enabled.

# When set to the input state, you can only read values. When set to the output state, you can read and write values.

- `cat /sys/class/gpio/PP.06/value #Get GPIO value.`

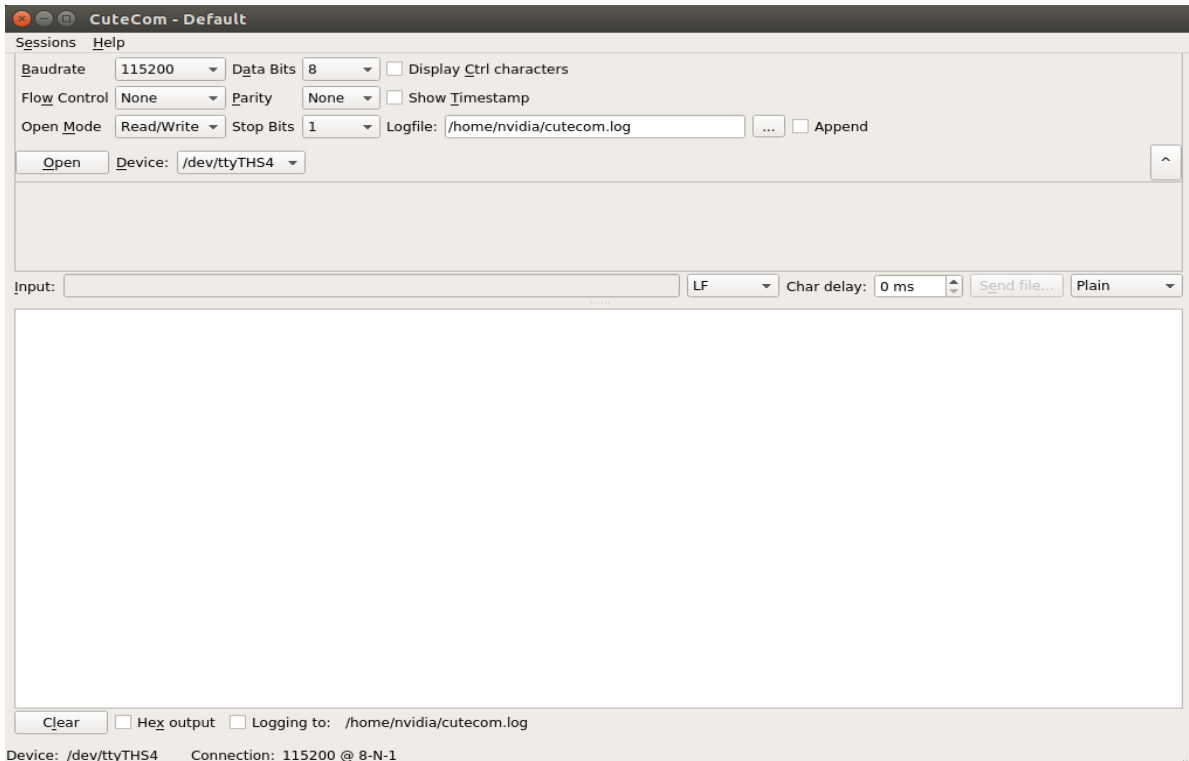

# The output state can be measured using a multimeter to measure the voltage between the specific lead heel GND.

# 10 Serial Port Test

Y-C17 is equipped with two 3.3V TTL serial ports as standard when it is paired with Jetson module, which can be used for self-collecting test of a single serial port and interconnection test of two serial ports. The command is as follows:

- `sudo apt-get install cutecom` #Install the serial port test tool
- `sudo cutecom` # For a single-serial port test, you only need to open one cutecom interface on each terminal. For a two-serial port connection test, use two terminals and open two cutecom interfaces.
- When testing a single serial port, connect the RX of a single serial port to the TX. When the two serial ports are connected, the RX of UART1 is connected to the TX of UART2, and the TX of UART1 is connected to the RX of UART2.

The interface of the serial port test tool cutecom is as follows:

# 11 Special Instructions

---

- Initial system username: **nvidia** , password: **nvidia** , no password su. If root permissions are required, use sudo to grant permissions, or use sudo su to access the root user.
- The pre-installed system is pure by default and does not contain Jetpack software. You can use the following command to install the software. Do not replace or modify the default software source before installation:
  - `sudo apt-get update`
  - `sudo apt-get install nvidia-jetpack`
- It can also be installed over the network using SDKmanager software.
- For more information please refer to [:Jetson wiki \(plink-ai.com\)](http://jetson.wiki(plink-ai.com))
